

work day or on way from work to home. This database is very reliable and gives a good outlook of happened injuries and accidents.

Posti is a big organisation where employees are working outside when delivering newspapers (early in the morning) and magazines and other post (in the daytime). Posti has their own database that includes information about injuries and other related data.

The information of slipping injuries from different sources and weather data are compared in this study.

Results The level of slipping injuries is clearly higher during winter time than during summer time. There seems to be quite visible correlation between temperature and number of slipping injuries, sometimes also snowfall seems to correlate quite well with the number of daily injuries. When temperature drops below zero degrees the number of slipping injuries use to raise.

Conclusions Slipping injuries are very common problem especially in countries located in places where ice and snow exist on winter time. There should be lot of potential available to decrease the number of slip injuries. This study presents the statistics of the slip injuries compared to weather. Also, suggestions are given how the awareness of the slipperiness could be improved.

588 SPONSOR BEHAVIOUR AND IMPACTS IN PUBLIC SECTOR PROJECT MANAGEMENT

Tarja Kantolahti. Ministry of Social Affairs and Health, Finland

10.1136/injuryprev-2016-042156.588

Background Project management literature does not describe how the sponsor behaves during project control in this specific occupational safety and health (OSH) public sector project context. Project management literature does not describe how the sponsor perceives the impacts of projects in this OSH context. It also seems that the literature does not recognise how the behaviour of the sponsor is related to sponsor perceptions of project impact. The objective of this study is to increase understanding of sponsor behaviour and impacts in public sector projects from the viewpoint of the sponsors themselves.

Methods This study is based on the qualitative method. Interviewees were selected on the basis of archive material. Interviews were organised for twenty sponsors, and the experiences of the sponsors were analysed on the basis of Grounded Theory.

Results The study indicated that sponsor behaviour was polymorphic. The main terms found for sponsor were bureaucrat, participator, expert and observer. The results indicated that the sponsor recognised many impact dimensions. Connexions were found between the behaviour of the sponsor and the impact dimensions that were determined from the perceptions of the sponsor. This study also suggests that there is a relationship between the behaviour of the sponsor and how the sponsor recognised the impact dimensions of the project.

Conclusions This study increases the understanding that other sponsors, ministries, researchers and project executors have regarding sponsor actions in the OSH field. It provides better possibilities for open discussion of sponsor activities in public sector projects. The study provides improved opportunities for continuing discussion about the impact of projects. According to the study, more research is needed on sponsor behaviour.

589 PHYSICAL DEMANDS OF FIRE FIGHTING FOR SEAFARERS-AN EMERGING ASPECT OF OCCUPATIONAL SAFETY IN SEAFARING

Susanna Visuri, Paivi Miilunpalo, Harri Lindholm, Sirpa Lusa, Ari-Pekka Rauttola, Mia Pylkkonen. Finnish Institute of Occupational Health

10.1136/injuryprev-2016-042156.589

Background All seafarers with designated emergency tasks must take part to a basic safety training including a course of basic fire fighting despite their physical fitness. Physical fitness of seafarers is often unsatisfactory, obesity and ageing impair it even further. There is not much information about the physical strain of the courses' exercises for seafarers. Therefore the aim of the study was to measure physical strain of seafarers during a fire fighting course.

Methods Fourteen male master mariner students aged 19–21 attended to a simulated smoke-diving drill with self-contained breathing apparatus (SCBA). Perceived exertion was assessed by Borg scale and energetic strain was assessed by estimating oxygen consumption indirectly with heart rate variability method. Students conducted two exercises in pairs with SCBA. In the first exercise, each pair walked through warm, smoke filled enclosed spaces. The second exercise started with a fire attack and continued by searching and rescuing a victim (a doll, weight 30 kg).

Results The first exercise lasted on average 14 minutes. During the exercise, the highest heart rate (HR) level was on average 145 (123–169) b/min and the maximum oxygen intake (VO₂max) 34 (25–42) ml/min/kg. The physical load was 7 (3–10) MET and perceived exertion on average was 11 (7–15). The second exercise lasted on average 12 minutes. The highest HR level was on average 167 (126–181) b/min and VO₂max was 40 (27–49) ml/min/kg. The physical load of exercise was 10 (6–12) MET and the perceived exertion on average was 13 (9–15).

Conclusions Seafarers' safe performance during basic fire fighting course requires aerobic fitness equivalent to extremely vigorous intensity activities (like running stairs up). The real-life smoke-diving duties on ship have been reported to be even more strainful. For the safety of seafarers, both promotion of physical fitness and regular training of emergency duties should be seen as an occupational safety issue.

Trauma Care and Rehabilitation

590 QUALITATIVE EVALUATION OF TRAUMA DELAYS IN ROAD TRAFFIC INJURY PATIENTS IN MARINGÁ, BRAZIL

^{1,2}Anjni Patel, ^{2,3}Joao Ricardo Vissoci, ²Catherine Staton. ¹Emory University, Atlanta, GA; ²Duke University, Durham, NC; ³Faculdade Ingá, Maringá, Brazil

10.1136/injuryprev-2016-042156.590

Background Road traffic injuries (RTIs) are the 8th leading cause of death worldwide, with 90% occurring in low- and middle-income countries (LMICs). In Brazil, more than 43,800 people are killed by RTI annually. There is limited research evaluating RTI transport delays to trauma centres in LMICs. The objective of this study is to determine specific causes of prehospital transport delays in RTI patients to trauma centres in Maringá, Brazil.

Methods We qualitatively evaluated the regional public prehospital system, Serviços de Atendimento Móvel de Urgência (SAMU),
