**INTRODUCTION**

Sri Lanka is a lower middle-income country in the South Asian Region which is facing a growing burden of road traffic crashes (RTCs). In Sri Lanka, RTCs lead to more than 2000 deaths and 14,000 casualties every year. We conducted this study to examine the trends of RTCs in Sri Lanka for the 30-year period between 1977 and 2007.

**METHODS**

We extracted the police reported RTCs between 1977 and 2007 from the police traffic headquarters, Sri Lanka. We calculated the crash and death rates per 100,000 population and analysed the trends of RTCs during the 30 years. We plotted graphs to show the trend of RTCs during this period.

**RESULTS**

Between 1977 and 2003, all types of road traffic crashes increased markedly in Sri Lanka: total (194.8%), fatal (81.8%), grievous (257.9%), non-grievous (69.2%) and damage only (303.5%). However, a reduction was observed in damage only (69.1%), non-grievous (16.8%) and total (48.2%) crashes from 2003 to 2007. However, fatal crashes and grievous crashes increased by 11.0% and 24.5% respectively.

**CONCLUSION**

Since 2003, damage only, and non-grievous crashes decreased markedly. However, such a reduction was not seen in more serious fatal and grievous crashes. In 2003, Sri Lankan insurance companies changed their insurance policies and introduced an on-the-spot payment scheme. No law amendment was introduced in 2003. Therefore, the reduction of damage only, and non-grievous crashes could be due to the high under reporting of crashes, rather than an actual reduction.
Trends of road traffic crashes in Sri Lanka
