reflected in changes both to the work health and safety legis-
lation and the newly introduced ISO 45001 standards.

It is difficult to implement effective protective strategies for
mental health and emotional wellbeing at work; especially, in
consideration of our individual differences, our life experi-
cences and the variance in mental health resilience we each bring
to the workplace.

Specific work demands such as the level of control over work,
social supports in the workplace, the emotional demands of the job, traumatic events, role ambiguity, role con-
lict, the meaningfulness of work, long working hours, and
the quality of relationships with supervisors were common
themes in work-related stress.

Exposure to dangerous working conditions (street outreach,
working alone with clients), client-initiated violence; and regu-
lar dealings with clients who have experienced physical and/or
emotional trauma, are all emotionally draining and present
across diverse industry sectors.

With many organisations using Employee Assistance Pro-
grams (EAP) to mitigate these stressors, we look at just how
effective are EAPs and what workplace supports work best.

**CHILD SAFETY IN SCHOOLS: APPRAISAL FROM
BENGALURU DISTRICT, INDIA**

Lakshmi Nair*, 1Naina Urs*, 1Gautham Melur Sukumar, 4Gururaj Gopalkrishna. 1Underwriters Laboratories; 2Bengaluru, India; 3Gururaj Gopalkrishna.

1Underwriters Laboratories, Bengaluru, India; 2Underwriters Laboratories, Bengaluru, India; 3NIMHANS, Bengaluru, India; 4NIMHANS, Bengaluru, India

10.1136/injuryprev-2021-safety.121

**Context** Child injuries are a growing public health problem in
India with nearly 5,00,000 child deaths in the last decade.

They are susceptible to injuries owing to their difficulty in
risk perceptions, curiosity, impulsivity and risk-taking behavior.

A national report titled, Advancing Child Safety in India: Implementation is the Key, was released by National Institute
of Mental Health and Neuro Sciences (NIMHANS) and
Underwriters Laboratories. The report emphasizes the need to
increase awareness about safety standards in schools amongst the key stakeholders.

**Process** Apart from the secondary research from key data sour-
ces, the report also includes the insights from safety appraisals
conducted across 131 schools (public and private) in Bengal-
uru and Kolar districts. These schools were assessed and
scored on physical infrastructure, road and fire safety and
first-aid facilities.

**Analysis** Every day, about 165 children die in India due to an
unintentional injury. From an official report in 2015, it is esti-
mated that 60,445 children aged 0–18 years died as a result of
injuries Out of these, 45,636 deaths were due to uninten-
tional injuries like road crashes, burns, drowning, poisoning
and others in year 2015.

From the primary research, overall safety in schools was
observed to be 50.8% of expected levels.

**Outcomes** A first of its kind technical and advocacy document
that provides information for stakeholders to plan appropriate
safety interventions for children in India.

**Learning Outcomes** Strict implementation of existing policies,
programs and legislations is the key to reduce child injuries in
India.
Results The injuries decreased close to the half at the SSP promoting schools, while the other groups didn’t show significant change. As for the intentional injuries and mental harms related to bulling, the clear changes were not identified yet, but the number of students who have uncomfortable experience with others have declined and the behaviors and/or conversations among students become more positive and friendly.

Conclusion With SSP programs, the schools can reduce injuries and increase positive communication. Those achievements in making schools safer have been made through the development of the capacities and the ownership of the students as well as teachers. In addition, the network with parents and communities have been developed through the programs.

Learning Outcomes Children’s capacities gained through SSP can be applied not only to injury prevention but also to any risks for the rest of their lives.

58.001 DEVELOPING BEHAVIOURAL THEORY GROUNDED AND USER-CENTRED MOBILE APP TO PREVENT INFANT FALLS

1Nipuna Cooray*, 2Si Sun, 3Susan Adams, 1Jane Elkington, 1Catherine Ho, 1Lisa Keay, 4Natasha Nassar, 1Julie Brown. 1The George Institute for Global Health, Newtown, Australia; 2University of New South Wales, Sydney, Australia; 3Sydney Children’s Hospital, Randwick, Australia; 4University of Sydney, Sydney, Australia

Background Digital behaviour change interventions (DBCI) are common public health tools but their use in injury prevention is limited. This paper presents the development and user-testing of the first module to be implemented in a mobile app designed as a DBCI to prevent infants falls.

Methods We used the Behaviour Change Wheel (BCW) to guide DBCI development, and review of literature and parent-oral forum discussions to identify target behaviours. These were mapped to Behaviour Change Techniques (BCTs) and a logic model was constructed. For pilot-testing, pregnant mothers were provided the app to review. Feedback through think-aloud interviews and an iterative process of user-testing was used to refine the app until comprehension criteria was reached: 80% of participants achieving ≥90% correct comprehension.

Results Development work identified key target behaviours, including mother getting adequate rest, safe feeding practices and safe infant placing after a feed. BCTs identified were information on health consequences, credible information, social support, prompts and cues, instruction and self-monitoring. For pilot-testing, 20 pregnant mothers were recruited, and 4 iterations of app refinement were required to reach the comprehension target. Acceptability was high and logic model changes were minimal.

Discussion and Conclusion This project demonstrates our novel development pathway and likely acceptance of the DBCI but further work is required to examine app engagement. Once fully implemented, the impact on behaviour change will be examined.

Learning Outcomes Use of the BCW and a user-centred approach is a feasible method for development of DBCI for injury prevention.

58.002 DEVELOPMENT OF AR APPLICATION AND DATABASE TO VISUALIZE RISKS OF HOME INJURIES

Miho Nishizaki*. Iwate Prefectural University, Takizawa, Japan

Background/Aims Accidental injuries among young children at home is a global issue. Previous research has indicated that some home injuries are preventable. Although the potential for home injuries is everywhere, it is sometimes difficult to anticipate injuries before they happen. Therefore, it is important to visualize children’s behaviors at home as part of an effort to mitigate the risk of injuries at home. This study presents a prototype augmented reality (AR) mobile application and web database system aimed at visualizing various children’s actions toward their home surroundings in order to prevent injuries.

Methods To visualize how children interacted with their surroundings in everyday environments, we conducted longitudinal observations of 15 children aged 4 to 12 months at their homes in Japan and Portugal. After shortlisting videos that related to the most frequently observed 10 objects, we then developed an AR application, converting the videos into line drawings so as to protect the identity of the participants. The database integrates all observational data and content of the AR application, comprising texts and movies of over 530 everyday objects that infants directly touched at home from 4,100 episodes.

Results As a result, AR application users are able to select the object in their own home environment and see how children interact with it. The AR application provided insight into the interests and behaviors peculiar to young children, and the database enabled users to look for information that could identify potential causes of home injuries.

58.003 IMPACT OF UNINTENTIONAL CHILD INJURIES IN KAVREPALANCHOK DISTRICT OF NEPAL

1Sunil Kumar JOSHI*, 2Pratiksha Pathak. 1Nepal Injury Research Centre (NIRC), Kathmandu Medical College, Kathmandu, Nepal; 2Department of Community Medicine, Kathmandu Medical College, Kathmandu, Nepal

Background Among the children who meet unintentional injuries every year globally, many are left with some form of disability. The rehabilitation of these children is costly and difficult to afford due to poor economic resources. Thus, it highlights the importance of prevention of unintentional injuries.

Methods A cross-sectional analytical study was done in rural and urban areas of Kavrepalanchok District in Nepal. A total of 667 children aged 1–16 years were included. Impacts of injury on the children and their families were assessed.
