E-Posters P3 – Drowning, March 24, 2021

**P3.001** FATAL UNINTENTIONAL DROWNING IN INDONESIA: UNDERSTANDING THE GAP OF KNOWLEDGE
1,2Muthia Cenderadewi*, 1Richard Franklin*, 2Sue Devine. 1The University of Mataram, Indonesia, Mataram, Indonesia; 2James Cook University, Townsville, Australia

**Background** Most drowning deaths occur in low and middle-income countries (LMICs) (91%). However, a limited number of studies investigating unintentional drowning deaths were identified in LMICs, including in Indonesia.

**Objective** To investigate rates of unintentional drowning deaths in Indonesia, and to investigate the availability of drowning prevention strategies in Indonesia between 2010 and 2019.

**Methods** A systematic search, guided by PRISMA, was conducted to identify all relevant grey literatures, including government/other authoritative reports, policy statements and publications on drowning prevention in Indonesia between 2010 and 2019. A systematic search, guided by PRISMA, was conducted to identify all relevant grey literatures, including government/other authoritative reports, policy statements and issues papers, published between 2010 and 2019.

**Results** The unavailability of the national injury surveillance system, including for drowning deaths documentation, was identified in Indonesia. Data on drowning deaths in Indonesia were potentially underrepresented, due to inefficient data collection and insufficient continuity of data. The WHO 2014 Global Report on Drowning did not report drowning fatalities from Indonesia. According to The Global Burden of Disease Study, a downward trend of drowning deaths was observed in Indonesia between 2010 and 2017, from 0.52% of total deaths in 2010 to 0.35% of total deaths in 2017, with average annual percent change of -5.33%. The lack of publications on drowning prevention in Indonesia was identified, therefore strengthening of multi sectoral coordination is needed to ensure the sustainability of drowning prevention in Indonesia.

**Conclusion** Inefficient data collection in Indonesia hinders the planning, implementation, and evaluation of prevention strategies. Further research investigating the gap in drowning deaths data recording, analysis, reporting and dissemination is vital for the development of the national and regional injury surveillance system in Indonesia.

**P3.002** THE SOCIO-ECOLOGICAL NATURE OF DROWNING IN LMICS: REVIEW INFORMING HEALTH PROMOTION APPROACHES
1,2Muthia Cenderadewi*, 1,2Muthia Cenderadewi*, 1,2Muthia Cenderadewi*. 1The University of Mataram, Indonesia, Mataram, Indonesia; 2James Cook University, Townsville, Australia

**Background** Most deaths by drowning worldwide have occurred in low and middle-income countries (LMICs) (91%), particularly in Southeast Asia (35%) and Africa (20%). Poor data collection in LMICs hinders the planning, implementation, and evaluation of prevention strategies.

**Objective** To review the rates and risk factors of unintentional drowning in LMICs, and to identify its prevention strategies within a socio-ecological health promotion framework.

**Methods** A systematic search, guided by PRISMA, was conducted on Ovid MEDLINE, CINAHL, Informit health, PsycINFO (ProQuest), Scopus, SafetyLit, Google Scholar, and BioMed Central databases for all relevant studies published between 2012 and 2017. McMaster appraisal guideline was used for critical review.

**Results** The disparity of drowning data availability was observed across countries investigated. The highest rates were identified in lower-middle income South-east Asian countries. The socio-economic background of the family, overcrowding, and living close to water bodies were important predictors for paediatric drowning in LMICs, while the presence of mother as caregiver was identified as a protective factor. The over-reliance on individual-focused, behaviour-based preventive measures was identified.

**Conclusion** Further research focusing on developing relevant upstream, population-focused, socio-ecological approaches of drowning prevention and water safety promotion is needed to ensure the sustainability of drowning prevention in LMICs.
