Alcohol and substance abuse

0028 METHAMPHETAMINE EXPOSURES REPORTED TO UNITED STATES POISON CONTROL CENTERS, 2000–2019

Statement of purpose To investigate characteristics and trends of methamphetamine exposures reported to United States (US) poison control centers. Methods/Approach Data from the National Poison Data System were analyzed to investigate exposures to methamphetamine. Results From January 1, 2000 through December 31, 2019, US poison control centers managed 54,199 cases involving methamphetamine as the first-ranked substance. Adults 20–39 years old accounted for more than half (56.3%) of all cases. There were 1,291 deaths, of which 43.0% involved multiple-substance exposures. Among multiple-substance exposures in which methamphetamine was the first-ranked substance, stimulants and street drugs (excluding methamphetamine) were most commonly presented (22.7%), followed by opioids (19.0%). The substance class associated with the most fatalities was opioids (n=243, 26.6%). The rate of methamphetamine exposures per 100,000 US population increased by 79.5% from 2000–2005, then decreased by 68.0% from 2005–2007, followed by an increase of 614.6% from 2007–2019. From 2007–2019, the rate significantly increased among all age groups, except among 6–12-year-olds, and in all US regions. The rates of single-substance and multiple-substance exposures increased significantly from 2007–2019 by 456.7% (p<0.0001) and 843.6% (p<0.0001), respectively. From 2007–2019, the proportions of cases resulting in admission to a health care facility and serious medical outcome increased by 38.6% and 55.2%, respectively, and the fatality rate increased by 492.3%. Conclusions The rate of exposure to methamphetamine in the US declined initially following passage of the Combat Methamphetamine Epidemic Act of 2005. However, since 2007, the rate and severity of methamphetamine exposures in the US have increased. Significance This is the first study to analyze methamphetamine exposures among all age groups over an extensive time period in the US. The findings from this study can help inform future prevention, monitoring, and research efforts.

Alcohol and substance abuse

0031 RIDESHARING TRIPS AND ALCOHOL-INVOLVED MOTOR VEHICLE CRASHES

Statement of purpose We assessed suicide rates by mechanism within geographic divisions by urbanicity, age, race/ethnicity and sex to inform targeted approaches for suicide prevention strategies. We addressed health equity by highlighting potential disparities and differences between and within demographics, geographic divisions and urbanization levels. Methods/Approach We will conduct temporal trend analysis using population-based mortality data from the National Vital Statistics System between 2004 and 2018 to estimate trends in suicide rates. We will tabulate national annual counts of suicide deaths among U.S. residents, by injury mechanism, stratified by Census Divisions, 2013 NCHS urban-rural classification scheme for counties, age, race/ethnicity, and sex. Results In preliminary analysis using CDC WONDER we found certain mechanisms of suicide increasing. We found females had statistically significant higher crude rates of suicide by suffocation than by firearm in large central metro areas in New England (1.3; 0.3) and Middle Atlantic (1.2; 0.3) and in large fringe metro areas in New England (1.6; 0.4) and Middle Atlantic (1.3; 0.6). Males had statistically significant higher crude rates of suicide by suffocation than by firearm in large central metro areas in New England (6.0; 3.7) and Middle Atlantic (4.2; 3.5) and in large fringe metro areas in New England (6.4; 4.3). Suicide rates by firearm are highest in most other geographic and urbanization areas for sex. Further analyses will highlight trends in suicide rates by mechanism and by sex, age, race/ethnicity within geographic areas and urbanicity to elucidate differences between and within demographic groups. Conclusions Results may inform suicide prevention strategies for different populations based on overlapping demographics, geographic areas and urbanicity. Significance Using a health equity lens, we will provide nuanced suicide data needed for a multifaceted approach to inform suicide prevention strategies in the US.
